Current concepts and management of glioblastoma.

Department of Medicine I/Oncology, Comprehensive Cancer Center Central Nervous System Tumors Unit, Medical University of Vienna, Vienna, Austria.

Abstract
Glioblastoma is the most common malignant primary brain tumor in adults. Its often rapid clinical course, with many medical and psychosocial challenges, requires a multidisciplinary management. Modern multimodality treatment and care improve patients’ life expectancy and quality of life. This review covers major aspects of care of glioblastoma patients with a focus on the management of common symptoms and complications. We aim to provide a guide for clinicians confronted with glioblastoma patients in their everyday practice.
